

Retrospective

Kevin D

What went well

- I had a clear understanding of work requirements and implemented the test strategy efficiently.
- Streamlining the setup/teardown process to reset the testing environment improved productivity and reduced downtime between tests. So clearing the database and resetting it was easy.

What can be improved?

- Time was underestimated for the defect testing phase, leading to a time crunch for the presentation phase.
- Tests could have been better written, so that they would more concisely follow the wireframe.

What work needs to be done next sprint

- For the next sprint I would have more tests to execute some of the MVP goals or stretch goals to go beyond basic testing
- Some edge cases that would need to be tested
 - Different types of images (Gifs)
